

B9651 – Marketing Analytics

Session 1: Course Introduction + Marketing Datasets

Professor Hortense Fong

A Primer on Marketing Problems: Online Banking

- 1990's: many firms started preparing for the “digital revolution”
 - Example: banks started investigating online banking
 - First analysis: compared profits generated by offline (traditional) vs online customers
 - Wanted to assess whether the new online channel increases profits
 - What happened? **Offline customers were much more profitable than online!**
 - What went wrong? In-depth analysis showed that online customers were much younger
 - Should compare younger offline customers with younger online customers and older offline customers with older online customers
 - → Found online customers more profitable!
- By the end of this class, you should be able to:
 - Ask relevant marketing questions
 - Know where and how to collect information/datasets
 - Extract meaningful insights!

2024 Marketing Technology Landscape May 2024

Google Trends on Marketing

This is (Mostly) the Past

Prior to the 90's

Products and brands were the center of the marketing activity (e.g., mass market, mass media, and impersonal transactions)

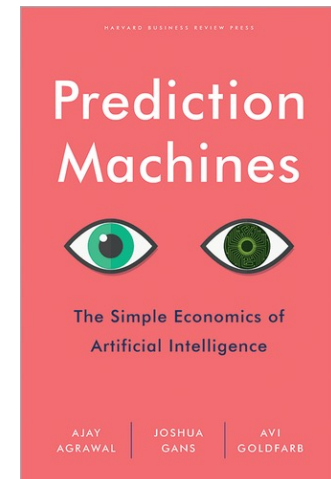

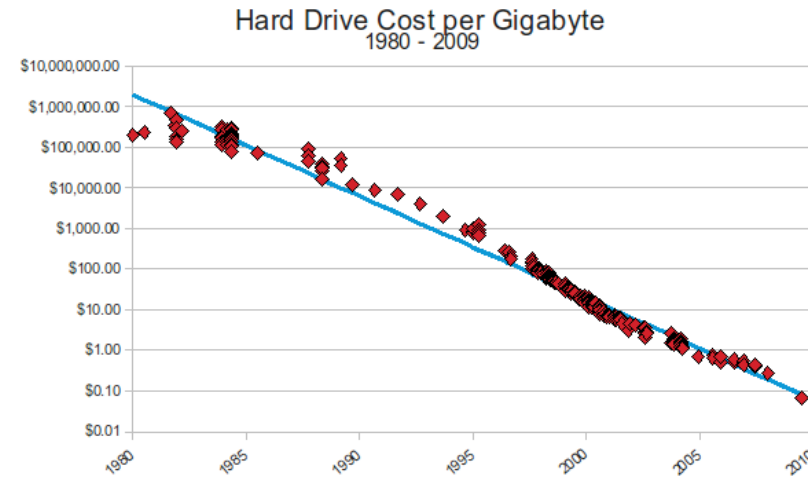

Build it and they will come!

(Customers exist to serve the marketplace)

A Few Technological Trends

- Internet – real time!
- Data – cheaper to store
→ more and more data
- Computing – faster and cheaper to process information → more computing

The 1990's

- Initial findings from financial services:
 - A high concentration of profits among customers

The profit distribution of a west coast US bank

Table 1.2 Percentage profit per household

\$ Profit/ Household	% of Household	% of Balance	\$ Profit
Over \$600	0.19%	2.34%	\$3 021 332
\$550 to 599	1.45%	1.53%	\$945 321
\$350 to 549	1.78%	4.22%	\$1 353 798
\$200 to 349	2.80%	9.35%	\$4 354 323
\$150 to 199	3.88%	7.55%	\$3 456 387
\$100 to 149	6.03%	31.87%	\$2 435 678
\$0 to 99	13.88%	12.44%	\$978 453
-\$1 to -25	22.34%	14.32%	-\$7 345 234
-\$26 to -49	33.78%	9.90%	-\$2 435 654
-\$50 to -74	13.64%	5.50%	-\$877 954
Under -\$75	0.23%	0.98%	-\$324 165
Total	100.00%	100.00%	\$5 544 285

Not all customers are equal

The Result – Customer as a Unit of Analysis

- Aiming to proactively manage the ways individual customers, not only products, create profitability

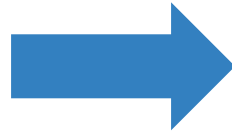

Customer Centricity & Drivers of Revenue

- Before:
 - New product development
 - One-way street in terms of communication
- Now:
 - Acquisition (of new customers)
 - Retention (of current customers)
 - Expansion (of revenue from current customers)

The New Rules of Customer Centricity

All Customers Are
Created Equal

**The
Customer
is
Always
Right**

Costco employee stories

Current and former store employees chimed in to paint a picture of the types of returns customer service can expect to see on any given day. Here's a sample:

- Sony boombox, over a decade old
- Old mattress with clear signs of urine stains
- Container of bones and fat, all that was left of a ribeye steak
- 13-year-old fish that had been found in a freezer
- Playset because "the kids grew up"
- 4-year-old Whirlpool washing machine
- 10-year-old sneakers

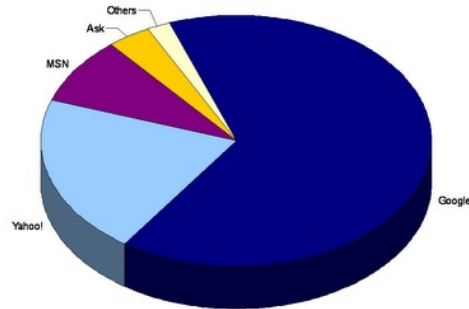

Here's What Happens When You Return Too Many Items to Costco

Published on May 4, 2023

- ✓ Too many returns to Costco and your account is likely to be flagged.
- ✓ Once flagged, you run the risk of losing membership privileges.

The New Rules of Customer Centricity

Some practices will be completely changed in the foreseeable future...
creating new challenges and opportunities!

Marketing According to You

What you think Marketing is?

What you want to learn?

So... What is Marketing?

Marketing is the art and science of identifying, delivering, and capturing value by understanding customers and their needs.

Marketing Analytics is about bridging the gap between quantitative tools and substantive marketing questions.

Why Marketing Analytics Hasn't Lived Up to Its Promise

“Why Marketing Analytics Hasn’t Lived Up to Its Promise”

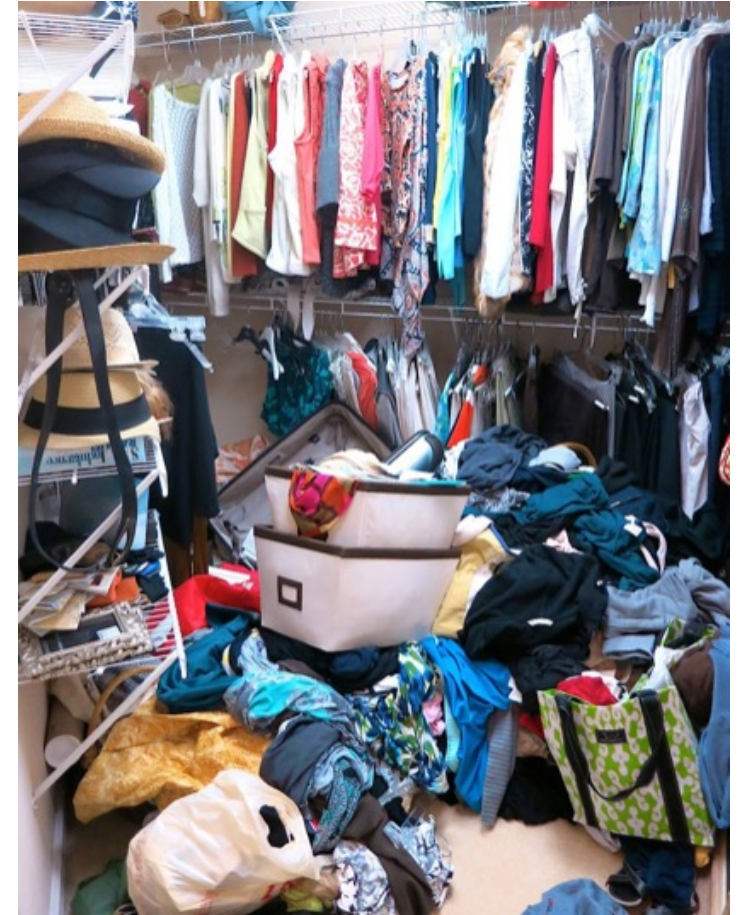

2018: 198% increase in planned allocation of marketing budgets to analytics in 3 years

But the effect of analytics on company-wide performance is modest (4.1 out of 7, on average).

Why are firms increasing marketing budgets when analytics does not contribute that much?

“Why Marketing Analytics Hasn’t Lived Up to Its Promise”

- **Data: Too much data = too little *information***
 - Ubiquitous, but difficult to obtain insight (cluttered closet)
 - Not integrated across platforms (e.g., mobile & PC browsing)
 - Can’t infer causality (e.g., correlation between search ad and purchase does NOT mean the ad caused the sale)

“Why Marketing Analytics Hasn’t Lived Up to Its Promise”

Key solution for an organized closet...

Decide what to do FIRST, then decide which data you need

“Why Marketing Analytics Hasn’t Lived Up to Its Promise”

- **Analyst Talent: Skill boundaries**
 - Clearly define the problem
 - Identify best tools
 - Spend time with customers IRL, *outside* data
 - Communicate insights, not jargon
 - Span skill boundaries (coding AND communication)
 - Takes time and practice → *this class is the first step*

Goal	Tool
Find causality (e.g., does ad increase sales)	Experiment
Prediction (e.g., expected future sales)	Supervised machine learning
Qualitative social media analysis (e.g., customer segments)	Unsupervised machine learning

Expectations

Marketing Datasets

What should you expect from us?

- Emails will be returned usually within 24-48 hrs
- Fair evaluation of student work
- Professor Office Hours Wed 2-3:30PM by appointment, TA Office Hours Thurs 10-11AM by appointment
 - [Google doc sign-up](#)
- Slides posted before class
- TAs
 - Penny Chen (YChen26@gsb.columbia.edu)
 - Eli Sugerman (Esugerman25@gsb.columbia.edu)
 - Yihan Luo (yl5426@columbia.edu)

What do I expect from you?

- Brush up on Python/Excel if needed
- Attendance is required
- Come to class prepared
 - Do the pre-class surveys and readings
 - Prepare the assigned cases
- Need full attention in class
 - Cellphones are turned off
 - No laptops, tablets are okay for notes
 - Have a pen and paper for note taking
- Be engaged in class discussion with classmates
- Challenge me: make sure you understand!
- Submit assignments on time – no late assignments will be accepted

The Starting Point: Data

We Generate TONS of Data!

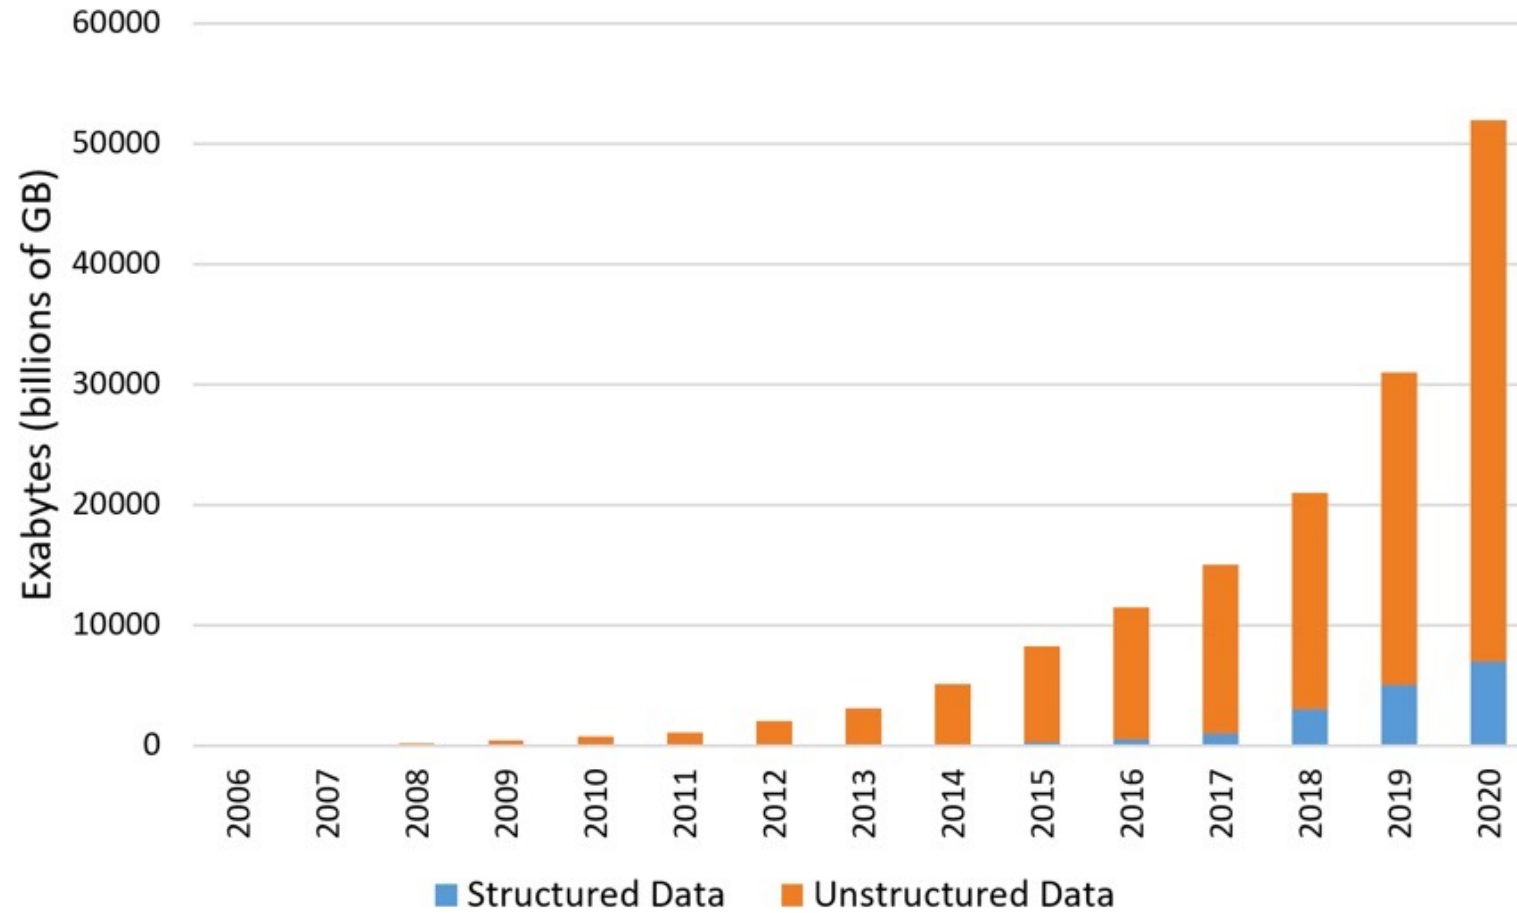

- ~44 zettabytes of data in the world beginning of 2020
 - One zettabyte = 10^{27}
- Predicted to be ~175 zettabytes of data by 2025

40x more data than observable stars in the universe!

Source: <https://seedscientific.com/how-much-data-is-created-every-day/>

Data Explosion!

Source: https://www.eetimes.com/author.asp?section_id=36&doc_id=1330462

Login to Poll Everywhere

Step 1: Go to **pollev.com/register** in your browser.

Step 2: Enter **hortensefong** in the dialog box and tap Search.

Why do we need data? Are there more words that begin with the letter K or more words that have K as their third letter?

0

Words that begin with the letter K

Words that have K as their third letter

But...Why do we need data?

A typical text contains twice as many words that have K as the third letter rather than the first

K first

1. Kitchen
2. Kangaroo
3. Kale

K third

1. Ask
2. Cake
3. Biking
4. Fake
5. Hiking
6. Ink

Availability Bias:

People assess the likelihood of something by the ease with which instances of that thing can be brought to mind.

Source: Tversky, Amos, and Daniel Kahneman. "Availability: A Heuristic for Judging Frequency and Probability." Cognitive Psychology 5, no. 2 (1973): 207-32.

Why do we need data/analysis to make decisions?

1. Humans have limited memory, and a limited ability to process and synthesize data
2. People are bad at learning from experience
 - **Overconfidence bias:** *subjective confidence is greater than objective accuracy*
 - **Confirmation bias:** *the tendency to search for, interpret, favor, and recall information in a way that confirms one's preexisting beliefs*
3. People are bad at judging probabilities

We (also) Need Structure

- Each dataset has pros and cons
 - What are they?
 - What type of question can I answer?
- Important to quickly know what is and is not possible with your data
- We need data and question taxonomies!

Data Taxonomy

	Primary Data <i>Data that is gathered by the researcher for the purpose of answering a specific question.</i>	Secondary Data <i>Data that was gathered for a purpose other than answering the specific question.</i>
Structured <i>Data that can be easily and meaningfully represented and manipulated in a traditional database (spreadsheet). Typically numeric or “choice” data.</i>	Surveys (ratings, choice) Experiments	Transaction logs Scanner panel data Ad tracking Product usage data
Unstructured <i>Data that cannot be meaningfully stored in a traditional data structure (spreadsheet) without further processing. Examples include text, images, video, and voice.</i>	Focus groups Interviews Surveys (free response) Observation Eye tracking Physiological/neural	Online reviews Social media Most digital content Call logs

Types of Marketing Research

Exploratory Research

(Ambiguous Problem)

“Our sales are declining and we do not know why.”

Descriptive Research

(Aware of Problem)

“What kinds of people are buying our products?”

“Who buys our competitors’ products?”

Causal Research

(Problem Clearly Defined)

“Will buyers purchase more of our product in a new package?”

Types of Marketing Research

Exploratory Research

(Ambiguous Problem)

“Our sales are declining and we do not know why.”

Use to...

1. Develop initial hunches or insights
2. Run a pilot study

Tools: secondary data, focus groups, survey opinion leaders, observation, etc.

Types of Marketing Research

Descriptive Research

(Aware of Problem)

“What kinds of people
are buying our
products?”

“Who buys our
competitors’ products?”

Use to...

1. Generate data describing characteristics of relevant customers
2. More specific and systematic than exploratory

Tools (similar to exploratory): secondary data, focus groups, surveys, etc.

Types of Marketing Research

Causal Research

(Problem Clearly Defined)

“Will buyers purchase more of our product in a new package?”

Use to...

1. Identify **cause-and-effect** relationships: If I do X, then Y.

Tools: Usually requires an **experiment** (e.g., A/B testing), there are quantitative techniques to identify causal relationships without an experiment

Example: New Coke, 1985

Taste tests showed that consumers preferred the taste of New Coke over old Coke and Pepsi, but...

How could this have happened?

Explanations

- Drinking experience (short sip versus full can)
- None of the marketing research informed the tasters that New Coke was going to replace the old Coke
 - Coke had a strong brand identity and consumers identified with the old brand
 - Consumers wanted to retain 'The Real Thing'
- Target market: bringing new customers in vs. pleasing existing ones

In short: they mistook exploratory for conclusive!

Primary Data

Unstructured

Data Taxonomy

	Primary Data <i>Data that is gathered by the researcher for the purpose of answering a specific question.</i>	Secondary Data <i>Data that was gathered for a purpose other than answering the specific question.</i>
Structured <i>Data that can be easily and meaningfully represented and manipulated in a traditional database (spreadsheet). Typically numeric or “choice” data.</i>	Surveys (ratings, choice) Experiments	Transaction logs Scanner panel data Ad tracking Product usage data Geospatial tracking
Unstructured <i>Data that cannot be meaningfully stored in a traditional data structure (spreadsheet) without further processing. Examples include text, images, video, and voice.</i>	Focus groups Interviews Surveys (free response) Observation Eye tracking Physiological/neural	Online reviews Social media Most digital content Call logs

Insights from Primary Marketing Data

- **Demographic characteristics** (Who)
- **Attitudes / opinions** (Thoughts)
- **Awareness** (Consideration set)
- **Intentions** (Intended actions)
- **Motivation/Protocol** (Why)
- Can explain discrepancy between:
 - Intention vs behavior ("I intended to buy, but...")
 - Attitude vs intention ("I like this product, but I won't buy it")

How to Gather Primary Data?

Ask: *what do people say/think*

Qualitative methods → *interpret* what people say

- In-depth interviews
- Focus groups

Quantitative methods → *measure* what people think/say

- Surveys

Observe: *what do people do*

- Direct observation
- Field experiments

How to Gather Primary Data?

Ask: *what do people say/think*

Qualitative methods → *interpret* what people say

- In-depth interviews
- Focus groups

Quantitative methods → *measure* what people think/say

- Surveys

Observe: *what do people do*

- Direct observation
- Field experiments

Qualitative Research

- **Qualitative research** aims to ***interpret what people say*** about their experiences.
- Studies tend to be **exploratory**. Use when you want to:
 - Probe attitudes and behaviors, looking for new opportunities
 - Establish basis for quantitative research
- Methods enable participants to express themselves openly/without constraint

Qualitative Research: In-depth Interviews

- **In-depth interviews** attempt to obtain detailed insights into consumers' lived experiences.
- **Format** is flexible (conducted at place of business, home, point of consumption, etc.)
- Can aid in:
 - **New Product Development:** Understand a market and identify gaps
 - **Repositioning:** Understand how a customer perceives the brand

And yet, Febreze didn't sell...

“The first inkling came when they visited a home outside Phoenix. They could smell her **nine cats** before coming inside. The house's interior, however, was **clean** and **organized**. She was somewhat of a **neat freak**, the woman explained... when they walked into the living room, where the cats lived, **the scent was so overpowering** that one of them gagged.”

Q: What do you do about the cat smell?

A: It's usually not a problem

Q: How often do you notice the smell?

A: Oh, about once a month

Q: Do you smell it now?

A: No

Qualitative Research: In-depth Interviews

Potential concerns with interviews:

- **Observer Interference:** being observed changes what we say
- **Spreading activation:** the brain retrieves memories by moving through networks of ideas. The ideas we prompt first determine the path
- **Representativeness:** does the sample match our customer base?
- **Leading questions:** risk pushing participants in a particular direction

Qualitative Research: Focus Groups

Focus groups attempt to capture the dynamics of consumer attitudes, feelings, beliefs, experiences, and reactions.

Format typically includes 8-10 *carefully chosen* (and incentivized) individuals, 1-2 moderators, for 1 hour.

Can aid in: developing product concepts, products, ad copy, script for further studies, questionnaire design

Qualitative Research: Focus Groups

Potential concerns with focus groups:

- **Observer Interference:** being observed changes what we say
- **Spreading activation:** the brain retrieves memories by moving through networks of ideas. The ideas we prompt first determine the path.
- **Representativeness:** does the sample match our customer base?
- **Leading questions:** risk pushing participants in a particular direction
- Verbal and nonverbal **power and dominance cues** from participants

Qualitative Research: Focus Groups

Guidelines for conducting a focus group:

- When an idea comes up for discussion, stick to that idea until the group finishes with it
- One speaker at a time
- Everyone has to participate
- Encourage participants to disagree, if they do
- Have and follow a script
- Collect demographics at the end

Interviews vs. Focus Groups

	Focus Groups	Interviews
Social effects	Interpersonal idea stimulation	No peer pressure or power/dominance
Information content	More people per unit time (breadth)	More information per respondent (depth)
Logistics	Difficult to schedule, especially with targeted recruiting Small interviewer commitment Moderate analysis cost	Easy to schedule, especially with targeted recruiting Huge interviewer commitment High analysis cost?

Data Taxonomy

	Primary Data <i>Data that is gathered by the researcher for the purpose of answering a specific question.</i>	Secondary Data <i>Data that was gathered for a purpose other than answering the specific question.</i>
Structured <i>Data that can be easily and meaningfully represented and manipulated in a traditional database (spreadsheet). Typically numeric or “choice” data.</i>	Surveys (ratings, choice) Experiments	Transaction logs Scanner panel data Ad tracking Product usage data Geospatial tracking
Unstructured <i>Data that cannot be meaningfully stored in a traditional data structure (spreadsheet) without further processing. Examples include text, images, video, and voice.</i>	Focus groups Interviews Surveys (free response) Observation Eye tracking Physiological/neural	Online reviews Social media Most digital content Call logs

How to Gather Primary Data?

Ask: *what do people say/think*

Qualitative methods → *interpret* what people say

- In-depth interviews
- Focus groups

Quantitative methods → *measure* what people think/say

- Surveys

Observe: *what do people do*

- Direct observation
- Field experiments

Direct Observation

Observation attempts to watch how customers interact with products/services in the “real word.”

“**Hidden observer**” – researcher disguised as a shopper

Can identify:

- How long are lines?
- What are people looking at?
- How easy is it for them to find products?

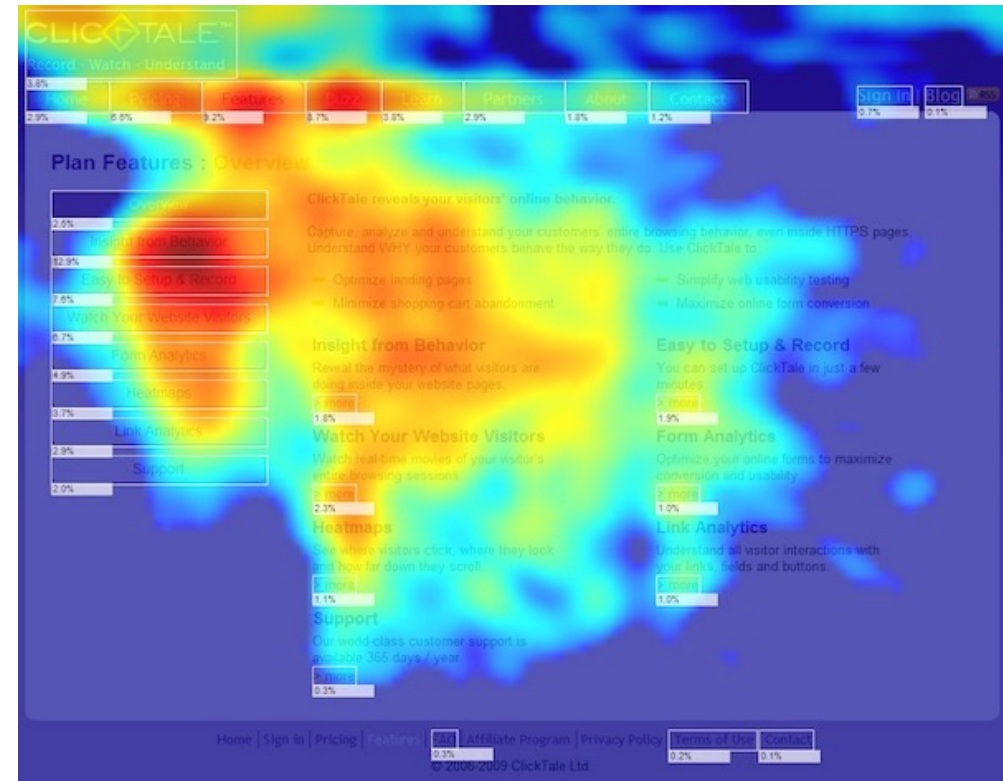

Direct Observation

Observation attempts to watch how customers interact with products/services in the “real word.”

Observing product usage

- In-person experiences
- Online user testing
- Biometrics

Direct Observation – Biometrics Data

Obvious benefit of biometric data: don't have to rely on self report

The image shows a woman sitting at a desk, wearing a dark blue polka-dot sleeveless top. She is equipped with several biometric sensors: eye-tracking glasses, a facial EMG sensor on her forehead, and skin conductance sensors on her forearms. Arrows point from these sensors to three blue callout boxes that describe the data being collected.

ATTENTION
- Eye-Tracking Glasses
- Heart Rate
*"Where is she looking?"
"Does her heartbeat follow the action?"*

EMOTION
- Facial EMG
"Is she smiling? Frowning?"

AROUSAL/INTENSITY
- Skin Conductance
Measures stress response, anxiety, arousal

Primary Data for Exploratory Research

- Questioning
 - Qualitative methods:
 - In-depth interviews
 - Focus groups
 - Quantitative methods:
 - Surveys
- Observation:
 - Direct observation
 - Field Experiments

Pros and Cons

	Questioning	Observation
Versatility	+	-
Realness (Accuracy)	-	+
Respondent Convenience	-	+

Primary Data

Structured

How to Gather Primary Data?

Ask: *what do people say/think*

Qualitative methods → *interpret* what people say

- In-depth interviews
- Focus groups

Quantitative methods → *measure* what people think/say

- Surveys

Observe: *what do people do*

- Direct observation
- Field experiments

Quantitative Research

Goal: **observe** and **measure** how people think and behave (results in numerical output)

Studies tend to be **descriptive** or **causal/confirmatory**:

- Identify the target base of customers (who are they)
- Identify what and why customers do what they do

Methods narrow in on a particular attitude or behavior:

- Observation
- Surveys
- Experiments

Quantitative Research: Survey

Surveys directly measure what consumers think, feel, or intend to do.

We need to think about a few things when designing surveys:

- How do we ask the question? (to avoid unsavory effects)
- Should the questions be open-ended or close-ended?
- What question type should we use? (measurement scales)
- Are the questions reliable? Are they valid?
- Is the sample representative of our customers?

Quantitative Research: Survey

How do we ask the questions?

Quantitative Research: Survey

Surveys directly measure what consumers think, feel, or intend to do.

When designing surveys, the way in which you ask questions is **crucial**.

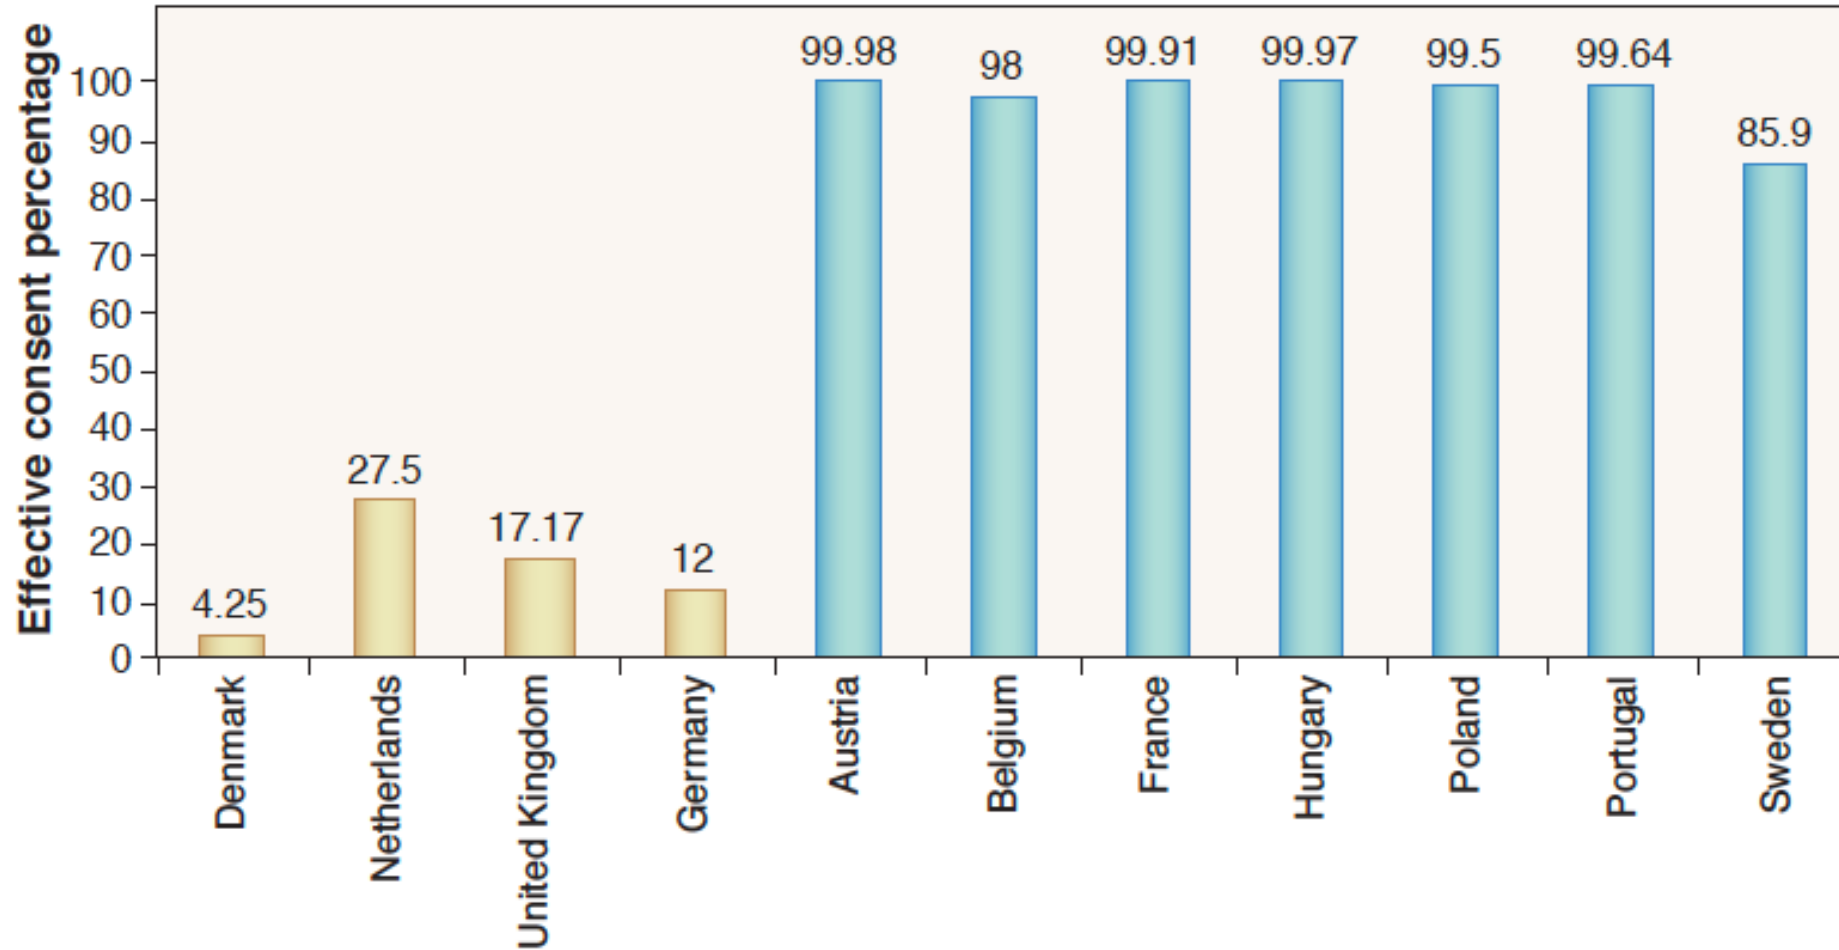

- **Priming effects:** preceding questions may influence response to focal questions
- **Framing effects:** the way you frame the question may change the answer
- **Leading questions:** when the question suggests a desired answer
- **Demand effects:** respondents may figure out your hypothesis and try to “help” you out

Priming Effects

Preceding questions may influence responses to the focal question:
How interested are you in buying this product?

Questions preceding the buying interest question	“Very Much Interested” in Buying
1. No question asked	2.8%
2. Asked only about advantages	16.7%
3. Asked only about disadvantages	0.0%
4. Asked about both advantages and disadvantages	5.7%

What Explains this Difference in Organ Donations?

Source: Johnson & Goldstein (Science, 2003)

Framing Effects

This is an example of a **default effect** – the tendency of people to stick with the default option.

☐

Check this box if you want to opt in

☒

Uncheck this box if you want to opt out

Framing Effects

A company designed a new automated car. Although the company worked hard on the security issues, it is **expected to injure 600 people**. To reduce this number, they designed two algorithms.

Assume the exact scientific estimate of the consequences of the algorithm are as follows:

Algorithm A: 200 people will be spared

Algorithm B: There is a $1/3$ probability that 600 people will not be injured, and a $2/3$ probability that no people will be spared.

Which algorithm do you prefer?

0

A

B

Framing Effects

A company designed a new automated car. Although the company worked hard on the security issues, it is **expected to injure 600 people**. To reduce this number, they designed two algorithms.

Assume the exact scientific estimate of the consequences of the algorithm are as follows:

72% **Algorithm A:** 200 people will be spared

28% **Algorithm B:** There is a $1/3$ probability that 600 people will not be injured, and a $2/3$ probability that no people will be spared.

Framing Effects

A company designed a new automated car. Although the company worked hard on the security issues, it is **expected to injure 600 people**. To reduce this number, they designed two algorithms.

Assume the exact scientific estimate of the consequences of the algorithm are as follows:

22% **Algorithm A:** 400 people will be injured

78% **Algorithm B:** There is a $1/3$ probability that nobody will be injured, and a $2/3$ probability that 600 people will be injured

Framing Effects

Positive Framing

72% Algorithm A

28% Algorithm B

Negative Framing

22% Algorithm A

78% Algorithm B

Negative versus positive framing can make a huge difference, even if the options are identical!

Leading Questions

Leading: when the question suggests a desired answer

“Are you more likely to purchase now?” (Leading) vs.

“How likely are you to purchase now?” (Neutral)

“How good was your experience?” (Leading) vs.

“How do you feel about your experience?” (Neutral)

Could potentially cue participants to answer consistent with what you want to hear and increase demand!

Quantitative Research: Survey

Open-ended vs. Close-ended

Quantitative Research: Survey

Open-ended questions

(Unstructured)

Advantages:

- Similar to qualitative methods (depth)
- Captures things in the consumer's own language

Disadvantages:

- Depends on consumer's ability to articulate
- Difficult to analyze

Close-ended questions

(Structured)

Advantages:

- Easy to use, analyze, quantify
- Less threatening for respondent
- Less interviewer bias
- May jog respondent's memory

Disadvantages:

- Difficult to design
- Limited scope
- Usually requires pre-testing

Quantitative Research: Survey

What question type should we use?
(measurement scales)

Quantitative Research: Survey

Nominal (Categorical)	Ordinal	Interval (Ratings, Likert)	Ratio (Real numbers)

Quantitative Research: Survey

Nominal (Categorical)	Ordinal	Interval (Ratings, Likert)	Ratio (Real numbers)
<p><i>When craving fast food, which of the following are you most likely to order?</i></p> <ol style="list-style-type: none">1. Burger and fries2. Pizza3. Fried chicken <p>Labels have no order or meaning</p>			

Quantitative Research: Survey

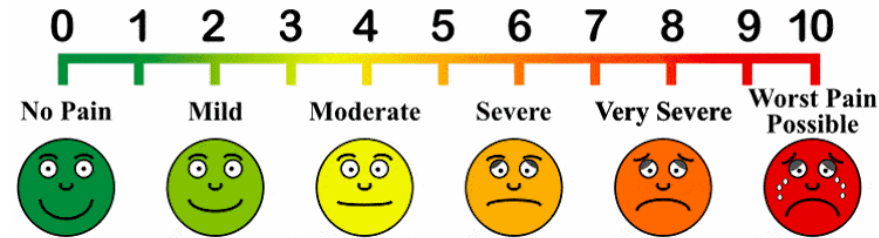

Nominal (Categorical)	Ordinal	Interval (Ratings, Likert)	Ratio (Real numbers)
<p><i>When craving fast food, which of the following are you most likely to order?</i></p> <ol style="list-style-type: none">1. Burger and fries2. Pizza3. Fried chicken <p>Labels have no order or meaning</p>	<p><i>What is the highest degree or level of education you have completed?</i></p> <ol style="list-style-type: none">1. Some high school2. High school3. Bachelor's Degree4. Master's Degree5. Ph.D. or higher <p>Options have an order, but no other numeric meaning</p>		

Quantitative Research: Survey

Nominal (Categorical)	Ordinal	Interval (Ratings, Likert)	Ratio (Real numbers)
<p><i>When craving fast food, which of the following are you most likely to order?</i></p> <ol style="list-style-type: none"> 1. Burger and fries 2. Pizza 3. Fried chicken <p>Labels have no order or meaning</p>	<p><i>What is the highest degree or level of education you have completed?</i></p> <ol style="list-style-type: none"> 1. Some high school 2. High school 3. Bachelor's Degree 4. Master's Degree 5. Ph.D. or higher <p>Options have an order, but no other numeric meaning</p>	<p><i>Rate the extent to which you agree with the following: I love going to B9651.</i></p> <ol style="list-style-type: none"> 1. Strongly agree 2. Agree 3. Neutral 4. Disagree 5. Strongly Disagree <p>Options have an order, and the <i>intervals</i> between options are equal</p>	

Interval Scales: Considerations

- Individual-level perceptions:

- Are scale differences truly equal?

Awesome Lyft!

You'll never be matched with a passenger you rate 3 stars or below

Quantitative Research: Survey

Nominal (Categorical)	Ordinal	Interval (Ratings, Likert)	Ratio (Real numbers)
<p><i>When craving fast food, which of the following are you most likely to order?</i></p> <ol style="list-style-type: none"> 1. Burger and fries 2. Pizza 3. Fried chicken <p>Labels have no order or meaning</p>	<p><i>What is the highest degree or level of education you have completed?</i></p> <ol style="list-style-type: none"> 1. Some high school 2. High school 3. Bachelor's Degree 4. Master's Degree 5. Ph.D. or higher <p>Options have an order, but no other numeric meaning</p>	<p><i>Rate the extent to which you agree with the following: I love going to MKTG-212.</i></p> <ol style="list-style-type: none"> 1. Strongly agree 2. Agree 3. Neutral 4. Disagree 5. Strongly Disagree <p>Options have an order, and the <i>intervals</i> between options are equal</p>	<p><i>What is your annual pre-tax income?</i></p> <p>_____</p> <p>Response is a <u>true number</u>, with a meaningful zero value</p>

Quantitative Research: Survey

The scale determines which analyses are possible!

Central tendency: what is the most representative response?

- **Nominal scale:** can only use **mode** (e.g., most people crave pizza)
- **Ordinal scale:** **median** and mode (e.g., the median education level of this class is a Bachelor's Degree)
- **Interval and ratio scale:** **mean (average)**, mode, median (e.g., the average pre-tax income for members of this class is...)

Common mistake: using mean for nominal scale

Quantitative Research: Survey

Are the questions reliable? Are they valid?

Quantitative Research: Survey

Reliability: Do people understand the question and how to respond?

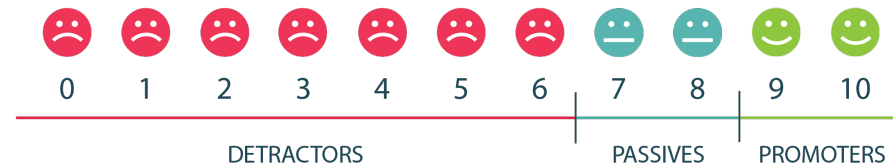

- **Test-retest reliability:** is the measure consistent over *time*?
 - If you were to re-measure brand love next year, would you get the same thing (assuming nothing changes in the environment)?
- **Internal consistency:** is the measure consistent across *related items*?
 - If you were to use 3 questions to measure brand love, do the answers move in the same direction?
- **Inter-rater reliability:** is it consistent across different researchers/judges?
 - If you were to ask two experts in branding whether the question measures brand love, will they agree?

Always a good idea to pretest!

Quantitative Research: Survey

Validity: Is the question measuring something meaningful?

E.g., what is a good measure of satisfaction?

$$\text{😊 \%} - \text{☹️ \%} = \text{NET PROMOTER SCORE}$$

How likely are you to recommend us to a colleague or friend?

Quantitative Research: Survey

Validity: Is the question measuring something meaningful?

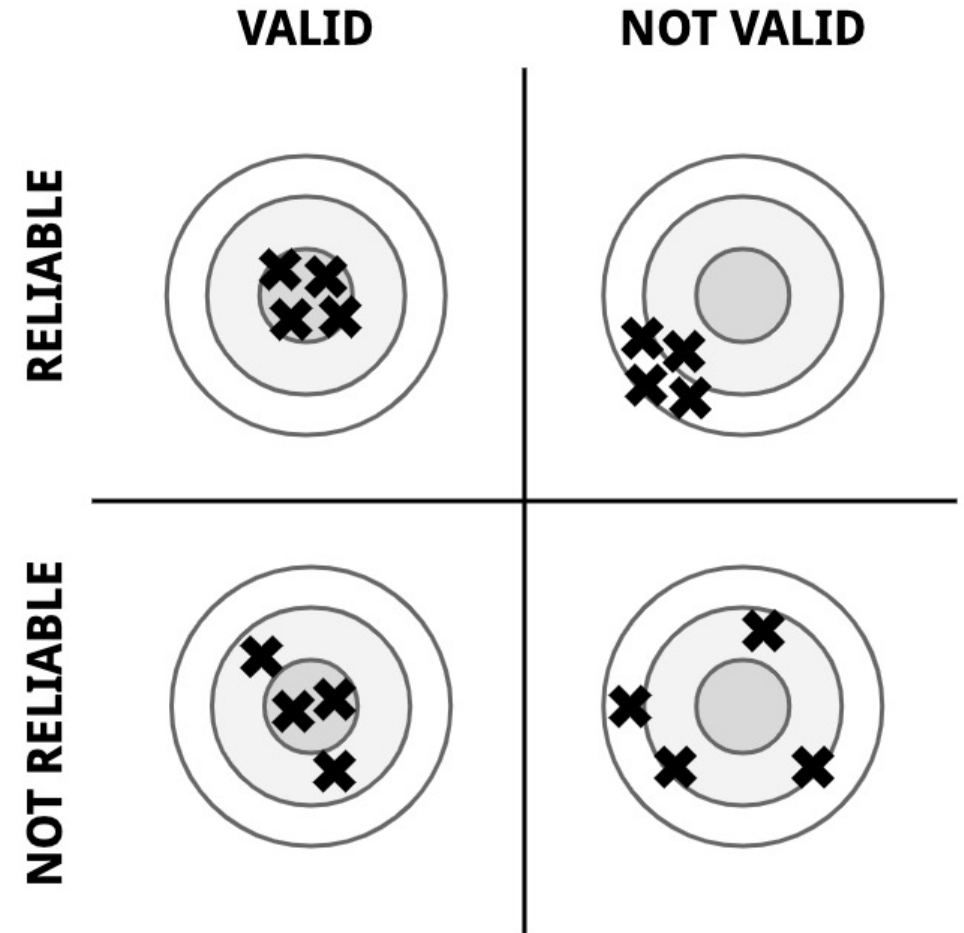

A few things to think about:

- What is the metric **capturing**?
 - E.g., are you *really* measuring satisfaction if you ask, “Do you like our brand?”
- How does it **compare** with other metrics?
 - E.g., is there a better way to measure satisfaction?
- How does the metric link with **managerial outcomes**?
 - E.g., does this measure of satisfaction have implications for how you do business?

Quantitative Research: Survey

Reliability: Do people understand the question and how to respond?

Validity: Is the question measuring something meaningful?

Quantitative Research: Survey

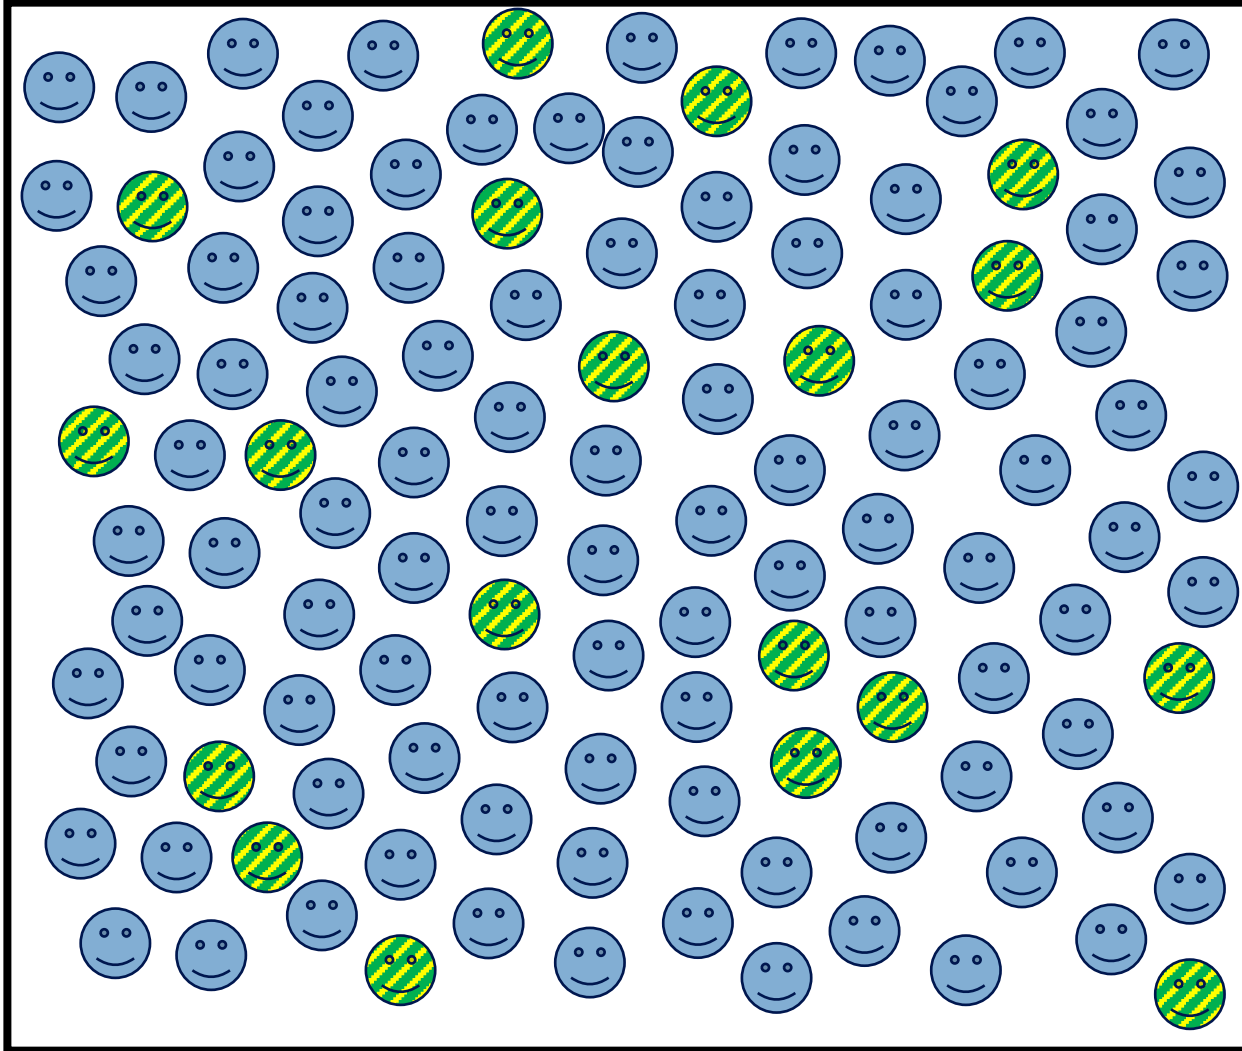

Is the sample representative of our customers?

Sampling and Representativeness

“This is interesting, 70% of the respondents to our survey said they don't respond to surveys.”

Quantitative Research: Surveys

For survey results to be meaningful, the set of people who respond must **represent** your customers.

Idea: Randomly sample the population

- Every person in the population has an equal chance of being sent the survey

Types of Marketing Research

Exploratory Research

(Ambiguous Problem)

“Our sales are declining and we do not know why.”

Descriptive Research

(Aware of Problem)

“What kinds of people are buying our products?”

“Who buys our competitors’ products?”

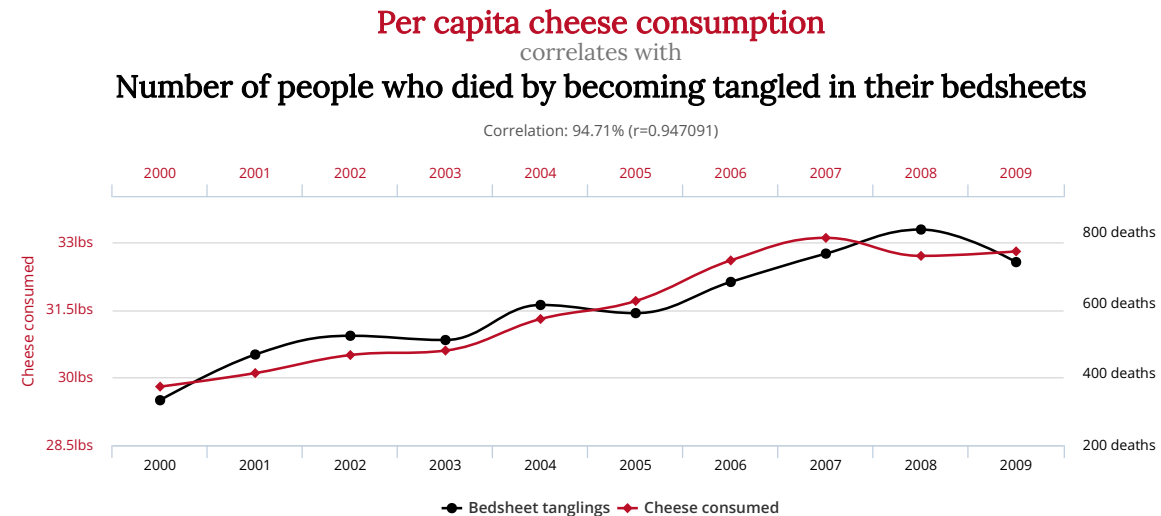

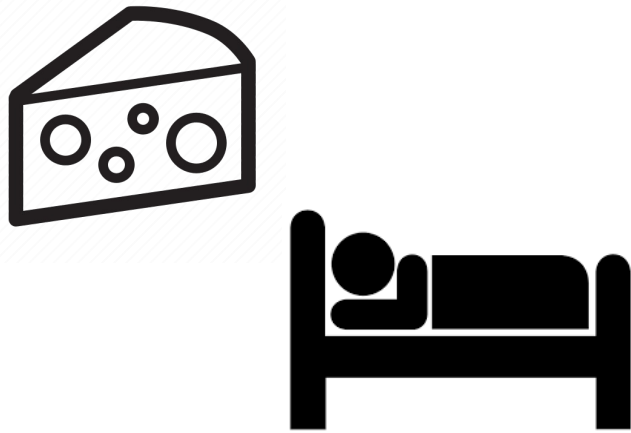

Causal Research

(Problem Clearly Defined)

“Will buyers purchase more of our product in a new package?”

Shortcomings of Surveys?

- Surveys are great at uncovering and describing a problem but:
 - Correlation (relation between X and Y) is not Causation (X causes Y)

- It guides us but doesn't allow us to take a stand: e.g., will my promotion work?
- Experimentation aims to understand the counterfactual universes

Why can't surveys address those questions?

No causation without (quasi-)experimentation.

We can guarantee that an observed effect is a causal effect by running an experiment where ...

No experimentation without manipulation.

... subjects are assigned to different conditions in which causal variables are systematically and differentially manipulated.

And randomization is necessary

However, more advanced statistical tools can be used when an experiment is not feasible.

Types of Marketing Research

Exploratory Research

(Ambiguous Problem)

“Our sales are declining and we do not know why.”

Descriptive Research

(Aware of Problem)

“What kinds of people are buying our products?”

“Who buys our competitors’ products?”

Causal Research

(Problem Clearly Defined)

“Will buyers purchase more of our product in a new package?”

How to Gather Primary Data?

Ask: *what do people say/think*

Qualitative methods → *interpret* what people say

- In-depth interviews
- Focus groups

Quantitative methods → *measure* what people think/say

- Surveys

Observe: *what do people do*

- Direct observation
- Field experiments

Causal Research

Experiments are everywhere, in practice:

- **Field experiments:** large-scale studies in “real life”

Facebook (secretly) manipulated users' mood by filling their news feeds with more negative vs. positive content from friends, then measured what type of content people posted (emotional contagion)

- **A/B (split) testing:** compare two or more versions of a variable (e.g., web page, advertisement, etc.)

Facebook for Business has an a/b testing feature

Data Taxonomy

	Primary Data <i>Data that is gathered by the researcher for the purpose of answering a specific question.</i>	Secondary Data <i>Data that was gathered for a purpose other than answering the specific question.</i>
Structured <i>Data that can be easily and meaningfully represented and manipulated in a traditional database (spreadsheet). Typically numeric or “choice” data.</i>	Surveys (ratings, choice) Experiments	Transaction logs Scanner panel data Ad tracking Product usage data Geospatial tracking
Unstructured <i>Data that cannot be meaningfully stored in a traditional data structure (spreadsheet) without further processing. Examples include text, images, video, and voice.</i>	Focus groups Interviews Surveys (free response) Observation Eye tracking Physiological/neural	Online reviews Social media Most digital content Call logs

Secondary Data

A few interesting ways to collect/utilize secondary data:

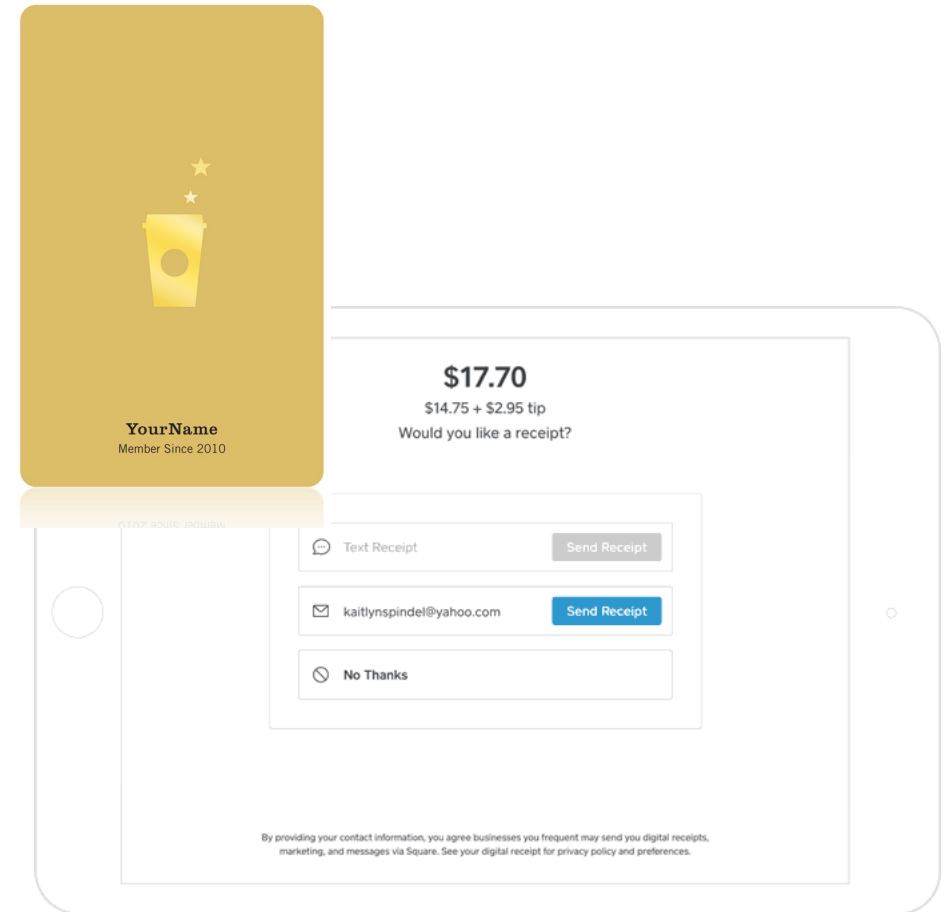

- Scanner & Point-of-Sale
- Geodemographics
- Media
- Web
- Mobile

Secondary Data

Structured

Secondary Data: Point-of-sale & Scanner Data

Secondary Data: Point-of-sale & Scanner Data

- The value of POS data:

Geography x Product x Time x Variables (e.g., price, promo)

- Retail market: where is the data?
 - CPG manufacturers
 - major warehouse and distribution centers
 - supermarkets
 - households

Each layer has its own data, and its own questions... which may require another layer's data!

Providers of POS & Scanner Data

The image displays three overlapping website screenshots. The top-left screenshot is the Nielsen website, featuring a dark header with the Nielsen logo and navigation links: INSIGHTS, SOLUTIONS, NEWS CENTER, and ABOUT. A search bar is located on the right. The top-right screenshot is the Circana website, with a dark header containing the Circana logo and navigation links: Solutions, Industries, Insights, and Company. A purple button labeled 'See for Yourself' and icons for search, user profile, and a globe are also present. The main content area of the Circana site features a large, abstract, colorful background with the headline 'Circana to Acquire Nielsen's Marketing Business' and a 'View the Press Release' button. The bottom screenshot is the SPINS website, which has a white header with the SPINS logo and navigation links: SCAN DATA, INSIGHTS, APPLICATIONS, COALITION, and ABOUT SPINS. The main content area is a large blue banner with the headline 'SPINSscan Natural' and the sub-headline 'Access information from the channel innovating products and defining the industry.' Below this is a navigation bar with tabs for NATURAL, SPECIALTY GOURMET, CONVENTIONAL, and STORE LEVEL. The bottom section of the SPINS site contains the text 'Identify, understand and anticipate the needs of your natural consumers.' and a large graphic with the text 'The Natural Channel represents an \$11.5 billion market opportunity and is at the epicenter of our industry.' followed by statistics: '60% Growth in sales volume (ACV)' and '28% Growth in store count' for the period '2013 versus 2008'.

Why would firms pay for this data?

The biggest factor: **Completeness**

- Linking aggregate sales to marketing instruments
- Individual-level purchase and marketing mix data
- Obtaining a richer set of performance measures beyond market share

What can you do with this data?

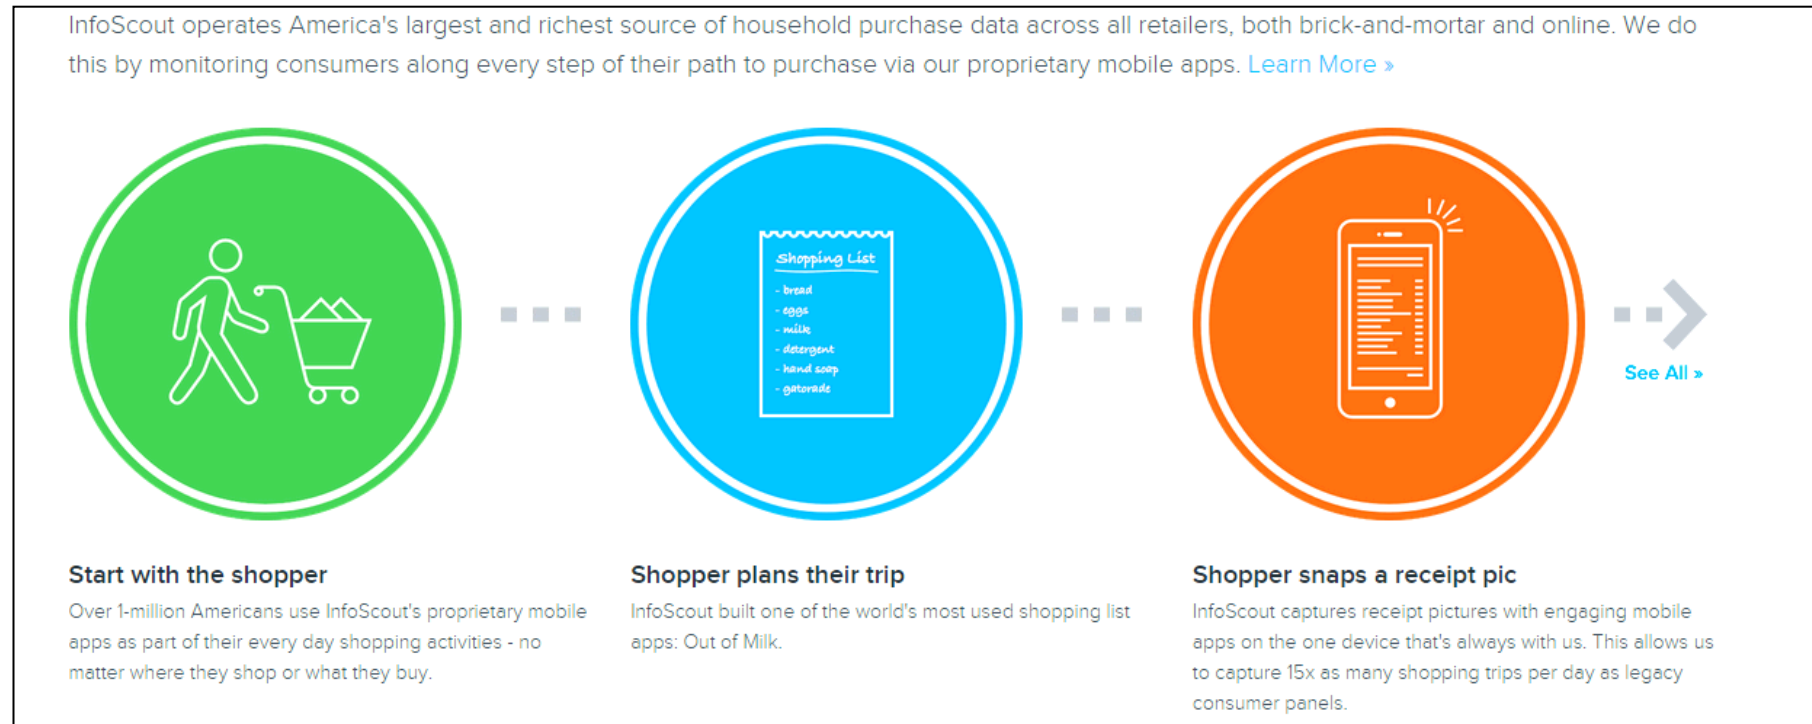

- **Pricing:** What is the optimal price?
- **Promotions:** Are they working? What's the impact?
- **Display:** Which type of displays (e.g., end of aisle) work better?
- **Basket composition:** Which categories are substitutes / complements?

Limitations of “Old-school” POS Data

- Not totally comprehensive: some stores manage (and do not share) their POS data (e.g., Trader Joe's so Nielsen does not have access to this data)
- Not **causal** – if we change the price, what will happen?
- Not detailed:
 - Who are these customers? (Demographics, psychographics)
 - How many are new/existing customers?
 - What does the path-to-purchase look like?

POS Data Solutions

Solution 1: self- report scanner panel data (e.g., iNFOSCOUT)

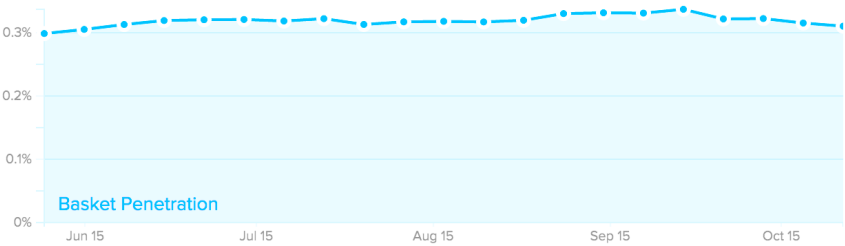

POS Data Solutions

Duracell Consumer Insights

Who buys Duracell?

Duracell Consumer Receipt Data

The sample data below is captured directly from our users' consumer shopping receipts.

Brand \$ per Basket	% of Basket \$ (median)	Total Basket \$ (median)
\$7.49	16.8%	\$44.61

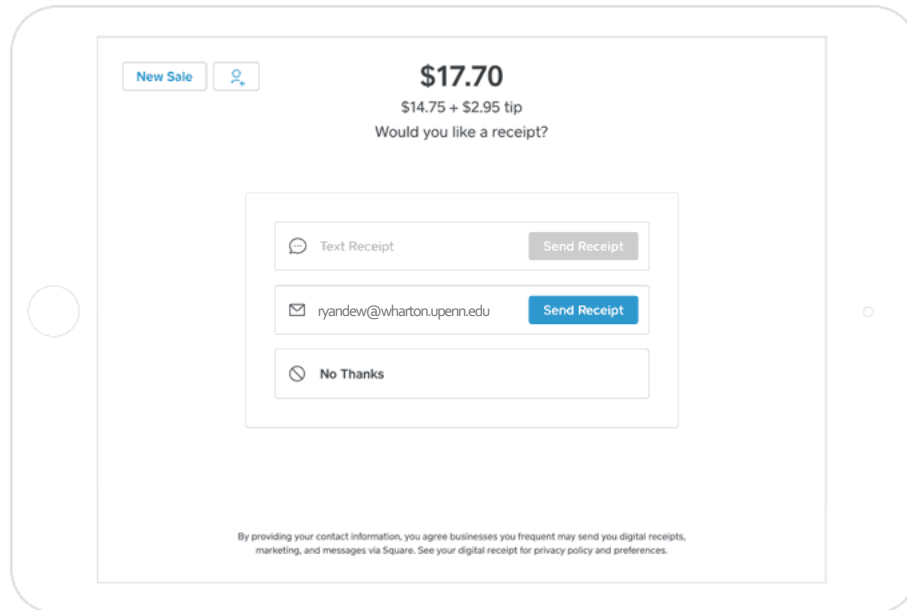

Users: 65+ years with \$80—125k income

Duracell Consumer Demographics

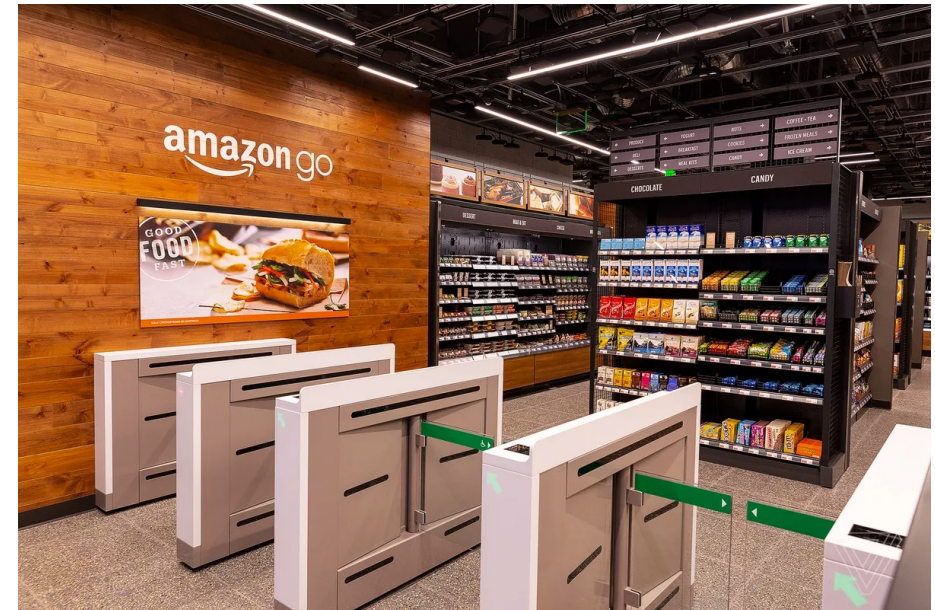

demographic	index	demographic	index
 Female	100	 Has Kids	98
 Male	102	 No Kids	104
 <24	69	 - \$20k	71
 25-34	77	 \$20k-40k	81
 35-44	100	 \$40k-60k	88
 45-54	113	 \$60k-80k	98
 55-64	131	 \$80k-100k	110
 65+	181	 \$100k-125k	115
 African American	67	 \$125k +	141
 Asian	111	 No College	89
 Caucasian	104	 College	99
 Hispanic	77	 Adv. Degree	119

POS Data Solutions

Solution 2: modern POS technology

Loyalty programs, email receipts
Match offline with online

Smart shelves, store beacons, apps
Track the whole in-store experience

Secondary Data: Geodemographics

Beware of demographic profiling! Similar demographics can conceal different lifestyles and interests.

Male
Caucasian
25 years old
Some college
<\$80,000/year

Manhattan, NY

Manhattan, KS

To make information more insightful and actionable: combine demographics with geography (and other data, e.g., purchasing)

Secondary Data: Geodemographics

- Geography is **actionable**:
 - Market scouting (open a store!)
 - Advertising planning and targeting
- **Market sizing**: understanding potential contagion
- Correlate with other outcomes:
 - Where are my best performing stores?
 - Who are the customers there?

ABOUT RENTRAK

RENTRAK CAREERS

INVESTOR RELATIONS

TV Essentials

Providing television measurement from more than 35 million screens and approximately 16 million households across the country, Rentrak is the trusted source for networks, agencies and advertisers, delivering the most precise and reliable TV ratings all day, every day across the largest media landscape.

TV ESSENTIALS OVERVIEW

Rentrak's TV Essentials® helps television buyers and sellers make smarter transactions by giving them a deeper understanding of the true value of their television viewing audience. Providing unparalleled TV measurement, this unique service gives agencies, advertisers and television networks access to massive amounts of exclusive viewership information for a level of granularity and stability absent from traditional television measurement services.

Advanced Demographics

Rentrak's Advanced Demographics allow users to more accurately pinpoint audiences they want to reach. By combining Rentrak's massive viewing intelligence with third-party consumer behavior information from sources like IHS, Experian, Simmons, and Epsilon, Rentrak users can dig deeper into TV

Exact Commercial Ratings®

A game-changer for the national television industry, the Exact Commercial Ratings® data metric allows advertisers and advertisers to determine how specific national TV commercial performs within an ad pod, advance the national TV industry standard measuring an average rating for commercials within a telecast (or providing individual commercial). When used along with the TV Essentials service, Exact Commercial Ratings network advertisers exactly how viewers were exposed to their commercials in a campaign, allow them to maximize the results of television spend.

SOLUTIONS

TELEVISION

Television and the way we watch it have come a long way since Nielsen began measuring TV audiences in 1950. Today, the ability to watch our favorite shows at any time and on multiple devices amplifies the need for exceptionally adept and flexible audience measurement capabilities.

And there's a big reason why Nielsen is synonymous with television audience measurement. We invented it. Since day one, we've offered the media industry the expertise it needs to make the best marketing decisions possible. Today, our expansive and representative television measurement services capture video viewing across different screens: television and computers.

WHAT WE MEASURE

Consumers are changing with the times, and the same goes for us. As technology continues to evolve and media companies try new ways to attract viewers, understanding what consumers are watching—and what they're watching on—is more important than ever. Today, viewing video is a personal and online experience. This media fragmentation is both a challenge and an opportunity.

TOTAL IT UP

TOGETHER, LET'S COUNT THE TOTAL AUDIENCE.

Secondary Data: Web Behavior Has Meaning

Takeaway: social media chatter and sentiment can be powerful predictors of real-life outcomes

Secondary Data: Web Behavior Has Meaning

Social Media Data Uses

- **Audience engagement** for a campaign
- **Brand mentions** vs. competitors: tracking “buzz”
- **Sentiment analysis**: do people like or hate us?
- **Segmentation**: understanding consumers by their social media
- **Brand perception**: when do people tag us?

Secondary Data: Web Data

Web Search vs. Social Media:

What can search data reveal that social media data might not?

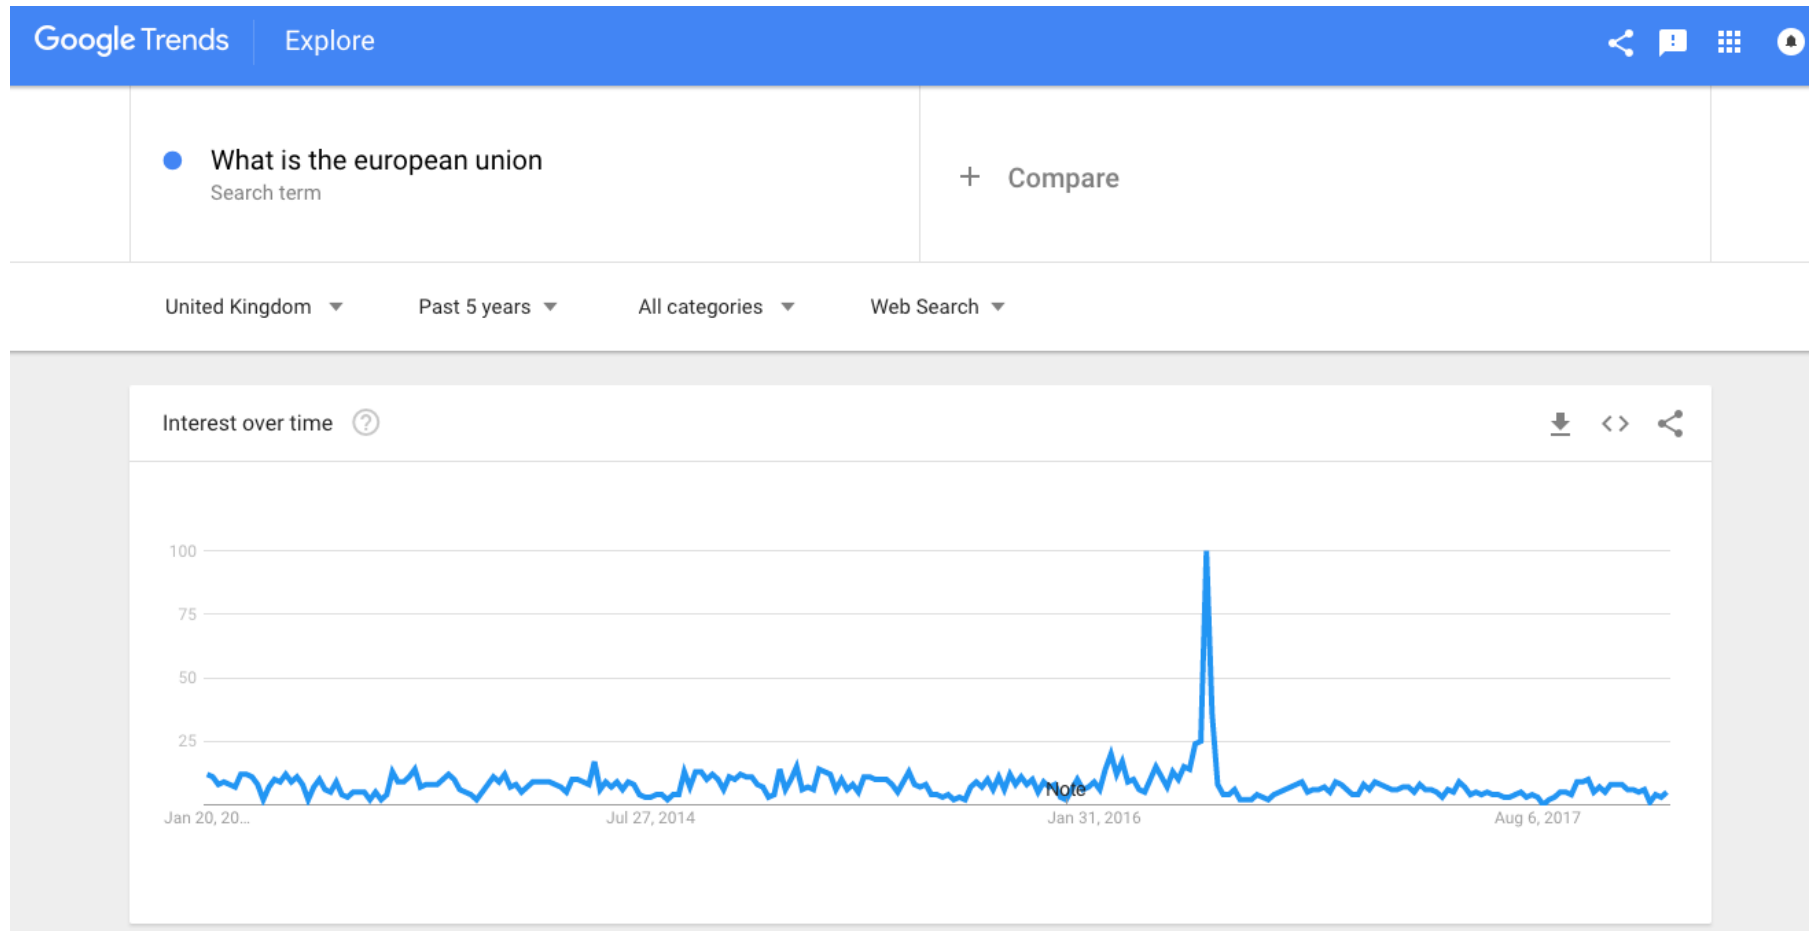

The Switch

The British are frantically Googling what the E.U. is, hours after voting to leave it

Secondary Data: Web Data

Secondary Data: Web Data

Web Search and Traffic Data Uses

Exploratory research:

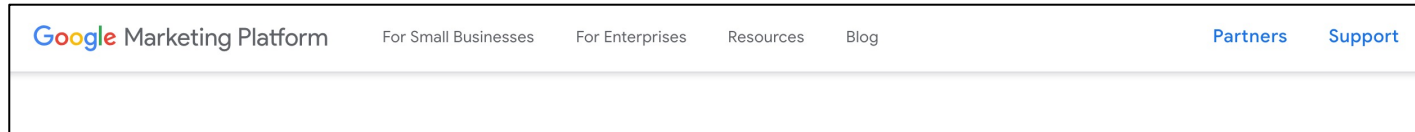

- The “ebbs and flows” of traffic
- Where are people coming from?

Measurement through the funnel:

- Who is noticing us?
- How do people become aware?
- Where do they go next?
- What else are they considering?

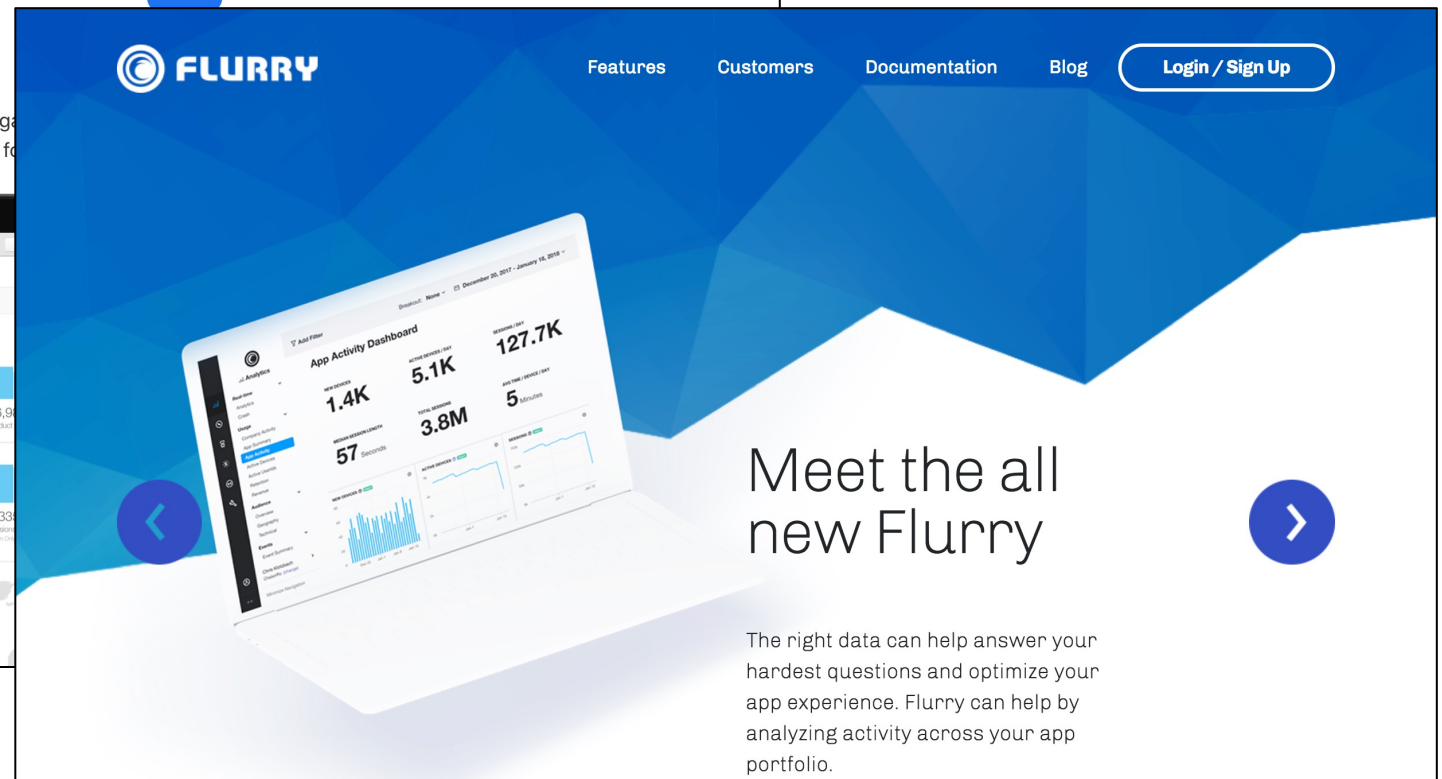

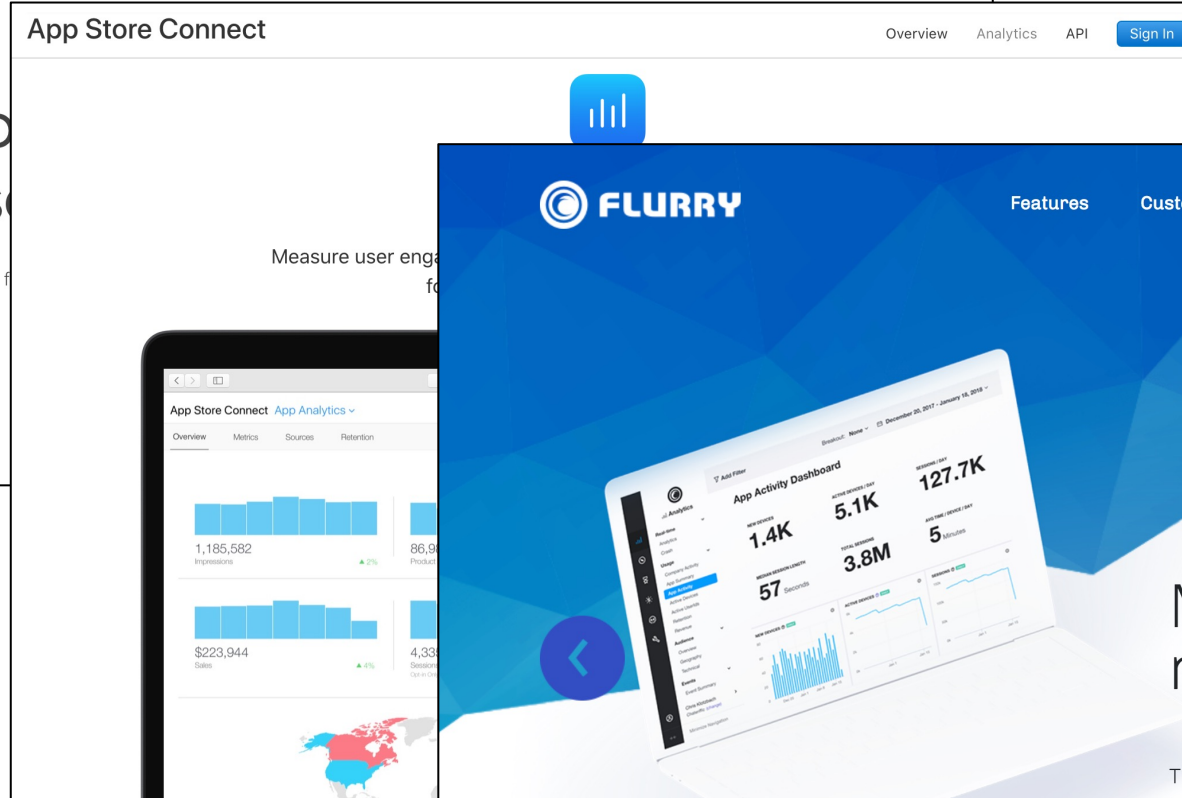

Secondary Data: Mobile Data

Easy-to-use tools for small businesses

“Will buyers purchase more of our product in a new package?”

Marketing Datasets: Takeaways

This was a whirlwind tour of marketing datasets!

- The amount of data available today is unprecedented and has created many opportunities
- We only scratched the surface of marketing dataset available, and barely discussed analysis

In the remainder of this course:

- We will keep encountering some of those datasets but will focus on the analytical tools
- We will pay close attention to every type of marketing research question (exploratory, descriptive, causal)

Wrap-Up

- Next class: Market Segmentation + Targeting
 - Cluster Analysis
 - Read Python for Marketing Research and Analytics (chapter 10)
 - Textbook can be found online
- (Post-class) Slides uploaded to Canvas under Week 1
- Recording in Echo360
- Groups will be formed over the weekend and we'll post Group Assignment 1
